

RAJARATA UNIVERSITY OF SRI LANKA
FACULTY OF APPLIED SCIENCES

B.Sc. (General) Degree in Applied Sciences
Third Year - Semester I Examination – June/July 2018

BIO 3206– EXPERIMENTAL DESIGN AND NONPARAMETRIC METHODS
IN STATISTICS

Time: Two (02) hours

Answer ALL questions.

1. a) Write short notes on following
- i. Principles of experimental designs
 - ii. Advantages of factorial experiments
- (10 marks)**
- b) Give names and linear models of three conventional experimental designs.
- (10 marks)**
2. An experiment was conducted to study the effect of four rations (R1, R2, R3, R4) on weight gain of table fish. Twelve homogenous fish tanks were prepared and each ration was assigned to randomly selected three fish tanks. After the experimental period, weight gain of fish in each tank (in kg) was measured. The results are summarized in the following table.

Ration	Wight (kg)		
R1	10.6	10.8	11.0
R2	8.1	8.8	8.5
R3	10.3	9.9	10.0
R4	6.0	6.6	6.1

- 2
- a) Conduct an appropriate statistical test to find out whether the effects of rations on weight gain is different ($\alpha = 0.05$).

Note: Clearly indicate your null hypothesis, alternative hypothesis and conclusions

(20 marks)

- b) Conduct a mean comparison using the least significant difference (LSD) test and discuss the results.

(10 marks)

3. Three laboratories were used in a study to find out the effect of two drugs (D1, D2) and two hormones (H1, H2) on antibody development of rats. The researcher is intended to eliminate the laboratory-to-laboratory variation. Hence the experiment was designed to replicate each treatment combination once in each lab (L1, L2, L3). The recorded antibody concentration under each combination is given in the following table.

Laboratory	Antibody concentration				
	L1	D1H1	D2H2	D1H2	D2H1
		25	14	8	9
	L2	D2H2	D1H2	D2H1	D1H1
		11	10	11	24
L3		D1H2	D2H1	D1H1	D2H2
		10	10	23	12

Conduct an appropriate statistical test to find out the effect of each factor and their interaction ($\alpha = 0.05$)

Note: Clearly indicate your null hypothesis, alternative hypothesis and conclusions

(30 marks)

- 3
4. An experiment was conducted to evaluate the taste of four sausage types (A, B, C, D). All types were given to each of six tasters and asked to indicate their preferences on a 0 to 100 scale. The data was analyzed using Minitab software and output is presented below.

Results for: 5_friedman.MTW

Friedman Test: scores versus type blocked by panelist (taster)

S = 16.00 DF = 3 P = 0.001

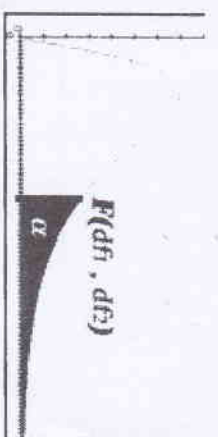

type	N	Est Median	Sum of Ranks
A	6	62.59	19.0
B	6	77.22	23.0
C	6	32.97	7.0
D	6	45.59	11.0

Grand median = 54.59

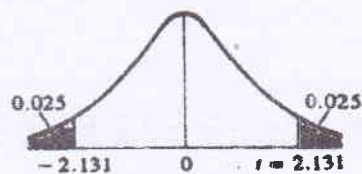

- a) Interpret the results using $\alpha = 0.05$. Clearly indicate your null hypothesis, alternative hypothesis and conclusions
(10 marks)
- b) Explain the next step of this analysis to find out the most preferred sausage type
(10 marks)

-----END-----
